The U.S. disability insurance system is an

important part of the federal social safety net; it provides financial protection to working-age Americans who have illnesses, injuries, or conditions that render them unable to work as they did before becoming disabled or that prevent them from adjusting to other work. An examination of the workings of the system, however, raises deep concerns about its financial stability and effectiveness. Disability rolls are rising, household income for the disabled is stagnant, and employment rates among people with disabilities are at an all-time low. Mary Daly and Richard Burkhauser contend that these outcomes are not inevitable; rather, they are reflections of the incentives built into public policies targeted at those with disabilities, namely the SSDI, SSI-disabled adults, and SSI-disabled children benefit programs. The Declining Work and Welfare of People with Disabilities considers how policies could be changed to improve the well-being of people with disabilities and to control the unsustainable growth in program costs.

When children and adults apply for disability benefits and claim that a visual impairment has limited their ability to function, the U.S. Social Security Administration (SSA) is required to determine their eligibility. To ensure that these determinations are made

fairly and consistently, SSA has developed criteria for eligibility and a process for assessing each claimant against the criteria. Visual Impairments: Determining Eligibility for Social Security Benefits examines SSA's methods of determining disability for people with visual impairments, recommends changes that could be made now to improve the process and the outcomes, and identifies research needed to develop improved methods for the future. The report assesses tests of visual function, including visual acuity and visual fields whether visual impairments could be measured directly through visual task performance or other means of assessing disability. These other means include job analysis databases, which include information on the importance of vision to job tasks or skills, and measures of health-related quality of life, which take a person-centered approach to assessing visual function testing of infants and children, which differs in important ways from standard adult tests.

This publication is timed to coincide with the half-century anniversary of the Disability Program. It chronicles the trends in federal disability programs. The report compiles data from national and international sources.

The United States Social Security Administration (SSA) administers two disability programs: Social Security Disability Insurance (SSDI), for disabled individuals, and their dependent family members, who have worked and contributed to the Social Security trust funds, and Supplemental Security Income (SSSI), which is a means-tested program based on income and financial assets for adults aged 65 years or older and disabled adults and children. Both programs require that claimants have a disability and meet specific medical criteria in order to qualify for benefits. SSA establishes the presence of a medically-determined impairment in individuals with mental disorders other than intellectual disability through the use of standard diagnostic criteria, which include symptoms and signs. These impairments are established largely on reports of signs and symptoms of impairment and functional limitation. Psychological Testing in the Service of Disability Determination considers the use of psychological tests in evaluating disability claims submitted to the SSA. This report critically reviews selected psychological tests, including symptom validity tests, that could contribute to SSA disability determinations. The report discusses the possible uses of such tests and their contribution to disability determinations. Psychological Testing in the Service of
