1. Essentials of Econometrics, 4th edition by Gujarati D. & Porter D. (2010) 2, Understanding Econometrics, by Dennis Halcoussis (2005) 3. Principles of Econometrics (4th ed) by RC Hill, WE Griffiths, GC Lim(2011) 4. Introductory Econometrics: A Modern Approach 4th edition by Woolridge J.M.(2009)

Covering all of the main topics, including panel data, that are expected in the first econometrics course, Understanding Econometrics uses a new, understandable approach that explains theory intuitively in English, not through a series of mathematical derivations. Recognizing that most students will not be doing economics graduate work, but that they may well need to understand econometrics and how to apply it, this new text focuses on the connection between theory and practice. The text uses a simplified notation system and examples that are integrated with the explanations of the material, fostering comprehension so that the instructor can focus more readily on theory and applications.

"Attempts to present a systematic discussion of the major benefits and costs of occupational licensing to the economies of the United States and several European countries." - page xiii.

This book explores the racial rules that are often hidden but perpetuate vast racial inequities in the United States.

The aim of this volume is to provide a general overview of the econometrics of panel data, both from a theoretical and from an applied viewpoint. Since the pioneering papers by Edwin Kuh (1959), Yair Mundlak (1961), Irving Hoch (1962), and Pietro Balestra and Marc Nerlove (1966), the pooling of cross sections and time series data has become an increasingly popular way of quantifying economic relationships. Each series provides information lacking in the other, so a combination of both leads to more accurate and reliable results than would be achievable by one type of series alone. Over the last 30 years much work has been done: investigation of the properties of the applied estimators and test statistics, analysis of dynamic models and the effects of eventual measurement errors, etc. These are just some of the problems addressed by this work. In addition, some specific diffi culties associated with the use of panel data, such as attrition, heterogeneity, selectivity bias, pseudo panels etc., have also been explored. The first objective of this book, which takes up Parts I and II, is to give as complete and up-to-date a presentation of these theoretical developments as possible. Part I is concerned with classical linear models and their extensions; Part II deals with nonlinear models and related issues: logit and pro bit models, latent variable models, duration and count data models, incomplete panels and selectivity bias, point processes, and simulation techniques.
